**Appendix C:** [North Gibson Priority Standards Vertical Articulation Document](#)

# High School Precalculus: Algebra Priority Standards

<b>Priority Standards</b>	<b>PC.CO.4</b>	Graph conic sections. Identify and describe features like center, vertex or vertices, focus or foci, directrix, axis of symmetry, major axis, minor axis, and eccentricity.
	<b>PC.EL.3</b>	Graph and solve real-world and other mathematical problems that can be modeled using exponential and logarithmic functions; interpret the solution and determine whether it is reasonable. Identify and describe features such as intercepts, domain, range, asymptotes, and end behavior.
	<b>PC.F.1</b>	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.
	<b>PC.QPR.5</b>	Understand the Fundamental Theorem of Algebra. Find a polynomial function of lowest degree with real coefficients when given its roots.
	<b>PC.SS.4</b>	Model and solve real-world problems involving applications of sequences and series, interpret the solutions and determine whether the solutions are reasonable.

<p><b>General Description of the Unit</b></p> <p>In this unit, students solve a variety of equations and inequalities, including: linear, quadratic, absolute value, and rational equations. For quadratic equations, students work with completing the square and use it to derive the quadratic formula. Students also work with complex numbers, including plotting on the complex plane. Many of the textbook sections are aligned to not aligned to any PreCalculus Indiana Academic Standards, but are still being taught as a review and to satisfy Dual-Credit requirements.</p>

1.7 Linear, Compound, and Absolute Value Inequalities  
(Review/Dual Credit)

**Formative Assessments**

**General Description of the Unit**

In this unit, students will expand on their understanding of key features of functions. They will explore composition of functions and even/odd functions. They will combine this knowledge with their previous understanding of functions to sketch a function from a verbal description of the key features and to identify key features from a given graph. Additionally, students will graph a circle on the coordinate plane. Finally, students find and use different types of linear models to interpret data and to make predictions. Many of these topics are used throughout the rest of the course.

**Priority Standards**

- **PC.F.1:** For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.

**Supporting Standards**

- **PC.CO.2:** Construct the equation of a circle of given center and radius. Complete the square to find the center and radius of a circle given by an equation.
- **PC.F.2:** Find linear models by using median fit and least squares regression methods, making use of technology. Decide which among several linear models gives a better fit. Interpret the slope and intercept in terms of the original context.
- **PC.F.3:** Compose functions and find the domain of composite functions.
- **PC.F.6:** Recognize even and odd functions from their graphs and algebraic expressions.

**Enduring Understandings**

- The equation of a circle with center  $(h, k)$  and radius  $r$  is  $(x-h)^2 + (y-k)^2 = r^2$ . If the equation is in standard form, the center and radius can be found from its equation by completing the square.
- Two functions can be composed, and this sometimes results in a new domain. We must consider domain restrictions on the composed function as well as the inner function.
- A function is even if it is symmetric about the  $y$ -axis and  $f(-x) = f(x)$ . A function is odd if it is symmetric about the origin and  $f(-x) = -f(x)$ .

**Essential Questions**

- The height of a thrown football is modeled by a function. Would you rather have the information given in a graph, table, or verbal description? What key information would the given representation be able to tell you about the football's path?
- What are some limitations of a linear model for a data set?
- What is a scenario where the composition of two functions would be helpful?

**Key Concepts**

- I can interpret key features, such as intercepts, intervals of increase or decrease, intervals where the function is positive or negative, relative extrema, symmetry, end behavior, and periodicity of a function given a graph. (PC.F.1)
- I can interpret key features, such as intercepts, intervals of increase or decrease, intervals where function is positive or negative, relative extrema, symmetry, end behavior, and periodicity of a function given a table. (PC.F.1)
- I can sketch a graph given a verbal description of a function. (PC.F.1)

**Related Concepts**

- I can use the center and radius of a circle to construct the equation of a circle. (PC.CO.2)
- I can complete the square in order to find the center and radius of a circle. (PC.CO.2)
- I can find a linear model using the median fit method. (PC.F.2)
- I can find a linear model using least squares regression while making use of technology. (PC.F.2)
- I can determine the best fit linear model when presented with multiple options. (PC.F.2)
- I can interpret the slope and intercept of a linear model in context. (PC.F.2)
- I can compose functions. (PC.F.3)
- I can find the domain of composite functions. (PC.F.3)

**Vocabulary**

- Center
- Complete the square
- Composite functions
- Composition of functions
- Decreasing
- Domain
- End behavior
- Equation of a circle
- Even function
- Increasing
- Intercepts
- Least squares regression
- Linear model
- Local maximum
- Local minimum
- Median-fit method
- Odd function
- Periodicity
- Pythagorean Theorem
- Radius
- Relative extrema
- Relative maximum

- I can recognize the role the domain of a function plays in the combination of functions. (PC.F.3)
- I can determine whether a function is even or odd graphically. (PC.F.6)
- I can determine whether a function is even or odd algebraically. (PC.F.6)

- Relative minimum
- Slope
- Symmetry
- x-intercept
- y-intercept

#### Formative Assessments

<b>General Description of the Unit</b> Within polynomial functions, students will derive the quadratic formula and will explore the roots of a polynomial using multiple theorems, including the Fundamental Theorem of Algebra, the Remainder Theorem, and the Factor Theorem. For rational functions, students will focus on their graphs and key features, including asymptotes and holes. Quadratic and power functions are also used to model bivariate data set; this builds upon the work with linear models that students did in the previous unit.		
<b>Priority Standards</b> <ul style="list-style-type: none"> <li>● <b>PC.QPR.5:</b> Understand the Fundamental Theorem of Algebra. Find a polynomial function of lowest degree with real coefficients when given its roots.</li> </ul>	<b>Supporting Standards</b> <ul style="list-style-type: none"> <li>● <b>PC.QPR.4:</b> Know and apply the Remainder Theorem and the Factor Theorem.</li> <li>● <b>PC.QPR.6:</b> Graph rational functions with and without technology. Identify and describe features such as intercepts, domain and range, and asymptotic and end behavior.</li> <li>● <b>PC.QPR.1:</b> Use the method of completing the square to transform any quadratic equation into an equation of the form <math>(x - p)^2 = q</math> that has the same solutions. ### Formative Assessments

<b>General Description of the Unit</b>		
<p>In this unit, students explore exponential and logarithmic functions and their inverse relationship. Students will model real-world problems using exponential and logarithmic functions and equations, including using these functions to model a data set. They will solve these problems using both graphing and algebra. The algebra will involve applying logarithmic laws and the change of base formula. The change of base formula is also used to prove simple logarithmic laws. It is important to note that students solve and graphed exponential and logarithmic equations in Algebra 2.</p>		
<p><b>Priority Standards</b></p> <ul style="list-style-type: none"> <li>● <b>PC.EL.3:</b> Graph and solve real-world and other mathematical problems that can be modeled using exponential and logarithmic functions; interpret the solution and determine whether it is reasonable. ### Formative Assessments

<b>General Description of the Unit</b> In this unit, students are introduced to the concept of conic sections for the first time. They will explore the definition of a conic section in terms of the intersection of a plane and double cone. Then they will graph conic sections (parabola, circle, ellipse, and hyperbola) and identify key information, including foci, directrix, axes, and vertex. Additionally, students will write the equation of a conic section from key information.		
<b>Priority Standards</b> <ul style="list-style-type: none"> <li>● <b>PC.CO.4:</b> Graph conic sections. Identify and describe features like center, vertex or vertices, focus or foci, directrix, axis of symmetry, major axis, minor axis, and eccentricity.</li> </ul>	<b>Supporting Standards</b> <ul style="list-style-type: none"> <li>● <b>PC.CO.1:</b> Construct the equation of a parabola given a focus and directrix.</li> <li>● <b>PC.CO.2:</b> Construct the equation of a circle of given center and radius. Complete the square to find the center and radius of a circle given by an equation.</li> <li>● <b>PC.CO.3:</b> Construct the equations of ellipses and hyperbolas given at least two of the following: foci, vertices, length of an axis, or point on the curve.</li> </ul>	
<b>Enduring Understandings</b> <ul style="list-style-type: none"> <li>● Conic sections are the result of a plane intersecting a double cone. There are four conic sections: a circle, parabola, hyperbola, and ellipse.</li> <li>● A parabola is a curve that is the set of all points that are equal distance from the directrix and the focus.</li> <li>● The quadratic equation for a parabola can be found from the directrix and focus.</li> <li>● The center and radius of a circle can be found from its equation by completing the square.</li> </ul>	<b>Essential Questions</b> <ul style="list-style-type: none"> <li>● How are the four conic sections similar and different?</li> <li>● What real world situations are modeled by conic sections?</li> <li>● How does the concept of a parabola as a conic section extend your understanding of quadratic equations?</li> <li>● If you are asked to find the equation of an ellipse, what two pieces of information would you prefer to have? Why?</li> </ul>	
<b>Key Concepts</b> <ul style="list-style-type: none"> <li>● I can graph conic sections. (PC.CO.4)</li> <li>● Given a conic section, I can identify the center, directrix, vertices, focus, and axis of symmetry. (PC.CO.4)</li> <li>● I can distinguish between the major axis and the minor axis of a conic section, where applicable. (PC.CO.4)</li> <li>● I can characterize the shape of a curve using the eccentricity of a conic section. (PC.CO.4)</li> </ul>	<b>Related Concepts</b> <ul style="list-style-type: none"> <li>● I can identify the vertex of a parabola as the halfway point between the focus and the directrix. (PC.CO.1)</li> <li>● I can determine the equation of a parabola given a focus and directrix. (PC.CO.1)</li> <li>● I can use the center and radius of a circle to construct the equation of a circle. (PC.CO.2)</li> <li>● I can complete the square in order to find the center and radius of a circle. (PC.CO.2)</li> <li>● I can write the equation of an ellipse given at least two pieces of information. (PC.CO.3)</li> <li>● I can write the equation of a hyperbola given at least two pieces of information. (PC.CO.3)</li> </ul>	<b>Vocabulary</b> <ul style="list-style-type: none"> <li>● Axis of symmetry</li> <li>● Center</li> <li>● Complete the square</li> <li>● Conic section</li> <li>● Directrix</li> <li>● Eccentricity</li> <li>● Ellipse</li> <li>● Equation of a circle</li> <li>● Foci</li> <li>● Focus</li> <li>● Focus (foci)</li> <li>● Hyperbola</li> <li>● Major axis</li> <li>● Minor axis</li> <li>● Parabola</li> <li>● Pythagorean Theorem</li> <li>● Radius</li> <li>● Vertex</li> <li>● Vertex (vertices)</li> <li>● Vertices</li> </ul>
<b>Mathematical Processes</b> <ul style="list-style-type: none"> <li>● PS.1 Make sense of problems and persevere in solving them.</li> <li>● PS.2 Reason abstractly and quantitatively.</li> </ul>

Ch 11: Analytic Geometry  
11.1 The Ellipse  
11.2 The Hyperbola  
11.3 The Parabola  
  
11.4 Rotation of Axes (SKIP)  
11.5 Polar Equations of Conics (SKIP)  
11.6 Plane Curves and Parametric Equations (SKIP)

### Formative Assessments

<b>General Description of the Unit</b> This unit serves as students' introduction to sequences and series, a topic that is foundational to Calculus. The heart of sequences and series in this unit is modeling and solving real-world situations with sequences and series. The focus is on arithmetic and geometric sequences and series.		
<b>Priority Standards</b> <ul style="list-style-type: none"> <li>• <b>PC.SS.4:</b> Model and solve real-world problems involving applications of sequences and series, interpret the solutions and determine whether the solutions are reasonable.</li> </ul>	<b>Supporting Standards</b> <ul style="list-style-type: none"> <li>• <b>PC.SS.1:</b> Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers.</li> <li>• <b>PC.SS.2:</b> Write arithmetic and geometric sequences both recursively and with an explicit formula; use them to model situations and translate between the two forms.</li> <li>• <b>PC.SS.3:</b> Find partial sums of arithmetic and geometric series and represent them using sigma notation.</li> </ul>	
<b>Enduring Understandings</b> <ul style="list-style-type: none"> <li>• Sequences and series can be used as models for real world situations. Any solutions must be checked against the context to ensure reasonableness.</li> <li>• Sequences are discrete functions that have either a finite or infinite number of terms.</li> <li>• Sequences may be defined explicitly or recursively in either function notation or subscript notation.</li> <li>• Some sequences are arithmetic, where each term is found by adding a constant amount to the previous term. Other sequences may be geometric, where each term is found by multiplying the previous term by the same number.</li> <li>• A series is a sum of the terms of a sequence. The sum can be calculated by hand or sometimes with formulas.</li> </ul>	<b>Essential Questions</b> <ul style="list-style-type: none"> <li>• What is a scenario that could be modeled by a sequence? By a series?</li> <li>• How are sequences and equations similar and different?</li> <li>• What characteristics of a situation would make it better modeled by a sequence than a function?</li> <li>• What are the similarities and differences between arithmetic sequences and linear functions? Between geometric sequences and exponential functions?</li> </ul>	
<b>Key Concepts</b> <ul style="list-style-type: none"> <li>• I can model and solve problems involving application of sequences and series. (PC.SS.4)</li> <li>• I can determine the validity of my solutions in the context of a problem. (PC.SS.4)</li> </ul>	<b>Related Concepts</b> <ul style="list-style-type: none"> <li>• I can recognize that a sequence is a function. (PC.SS.1)</li> <li>• I can define a sequence as a recursive function. (PC.SS.1)</li> <li>• I can define the domain of a recursive function as the subset of integers. (PC.SS.1)</li> <li>• I can write an arithmetic sequences both recursively and explicitly. (PC.SS.2)</li> <li>• I can write a geometric sequence both recursively and explicitly. (PC.SS.2)</li> <li>• I can use arithmetic and geometric sequences to model situations. (PC.SS.2)</li> <li>• I can translate between recursive formulas and explicit formulas. (PC.SS.2)</li> <li>• I can find partial sums of arithmetic series. (PC.SS.3)</li> <li>• I can find partial sums of geometric series. (PC.SS.3)</li> </ul>	<b>Vocabulary</b> <ul style="list-style-type: none"> <li>• Arithmetic sequence</li> <li>• Arithmetic series</li> <li>• Domain</li> <li>• Explicit formula</li> <li>• Geometric sequence</li> <li>• Geometric series</li> <li>• Integer</li> <li>• Partial sum</li> <li>• Recursive formula</li> <li>• Recursive function</li> <li>• Sequence</li> <li>• Series</li> <li>• Sigma notation</li> </ul>

- I can represent partial sums of arithmetic and geometric series using sigma notation. (PC.SS.3)
- I can understand the parts of a series written in sigma notation. (PC.SS.3)

**Mathematical Processes**

- PS.2 Reason abstractly and quantitatively.
- PS.6 Attend to precision.

## Unit 7: Intro to Calculus (Honors Only) (15 days, 2nd semester)

<b>General Description of the Unit</b>		
This is an optional unit for the honors section. The unit will cover the beginning of the calculus course, including limits (by graphing and algebraically), an introduction to derivatives (including the limit definition), and derivative rules.
